

A diagram of a spiral galaxy. The central region is a bright yellow disk. Surrounding this is a gray ring representing the dark matter halo. The outermost ring is a blue ring representing the visible matter (stars and gas). The blue ring is composed of many small blue circles, each containing a black dot, representing individual stars. The gray ring is also composed of many small gray circles, each containing a black dot, representing dark matter particles. The yellow disk is composed of many small yellow circles, each containing a black dot, representing stars in the central region.

Figure 1 is a scatter plot showing two concentric rings of data points. The inner ring consists of black points, and the outer ring consists of yellow points. Both rings are surrounded by a gray shaded region representing the uncertainty or confidence interval. The axes range from -20 to 20.

A scatter plot showing two concentric rings of data points. The inner ring consists of purple points, and the outer ring consists of yellow points. Both rings are surrounded by a light gray shaded region. The axes range from -20 to 20.
