

A diagram of a cell in the process of division. The cell is represented by a large, irregular, light gray shape. Inside the cell, there is a large, dark gray nucleus. The nucleus is surrounded by a thin, light gray membrane. The nucleus is divided into two parts, each containing a cluster of small, dark gray dots representing chromosomes. The chromosomes are arranged in a circular pattern, with some dots overlapping. The cell is surrounded by a thin, light gray border. The background is white.

A scatter plot illustrating three clusters of data points. The top cluster is a ring of purple points with pink ellipses. The bottom-left cluster is yellow points with pink ellipses. The bottom-right cluster is teal points with pink ellipses. Gray points are scattered in the background.

A scatter plot on a Cartesian coordinate system with x and y axes ranging from -20 to 20. The plot displays three distinct clusters of data points. The first cluster is a large, crescent-shaped ring of teal-colored points, each with a thick pink outline, forming a semi-circle around the center. The second cluster is a smaller, roughly circular group of yellow points with pink outlines, located in the center-left area. The third cluster is another smaller, roughly circular group of dark purple points with pink outlines, located in the center-right area. All points have a light gray shadow behind them.

A scatter plot illustrating three distinct clusters of data points. The x-axis and y-axis both range from -20 to 20. The first cluster, located in a large crescent shape, consists of teal-colored points with pink outlines. The second cluster, located in the center, consists of yellow-colored points with pink outlines. The third cluster, located to the right of the center, consists of dark purple-colored points with pink outlines. Each point is surrounded by a light gray shaded area, possibly representing a confidence interval or uncertainty.

A scatter plot illustrating a complex, non-linear decision boundary. The plot shows three classes of data points: yellow, purple, and teal. The teal points form a large, curved, semi-circular boundary around the other two classes. The yellow and purple points are clustered in the center. The plot illustrates a complex, non-linear decision boundary.

A scatter plot showing three classes of data points. The x-axis ranges from approximately -30 to 30, and the y-axis ranges from -25 to 25. The data points are colored purple, yellow, and teal. The purple points form a large, crescent-shaped cluster. The yellow points form a small, roughly circular cluster. The teal points form a small, roughly circular cluster. A light gray shaded region surrounds the purple cluster, indicating a decision boundary or uncertainty.

A scatter plot on a white background with a black border. The x-axis is labeled from -30 to 30 in increments of 10, with major ticks at -30, -20, -10, 0, 10, 20, and 30. The y-axis is labeled from -25 to 25 in increments of 10, with major ticks at -25, -15, -5, 5, 15, and 25. There are three distinct clusters of data points. The first cluster is a large, crescent-shaped ring of purple points, approximately 2 pixels thick, centered around the origin. The second cluster is a smaller, roughly circular group of orange points located in the lower-left quadrant, centered around (-15, 0). The third cluster is a group of teal points located in the upper-right quadrant, centered around (10, 10). Each point is a small circle with a thick border and a semi-transparent fill. The purple points have a greyish-purple fill, the orange points have a light orange fill, and the teal points have a light teal fill. The points are distributed such that the purple ring encloses the other two clusters.
