

A diagram of a spiral galaxy. The central region is a bright yellow disk. Surrounding this is a gray ring representing the disk. Within this gray ring, there are two concentric rings of small circles. The inner ring consists of yellow circles, and the outer ring consists of dark purple circles. These circles are arranged in a spiral pattern, representing the distribution of stars and gas in the galaxy.

A scatter plot showing two concentric rings of data points. The inner ring consists of dark purple points, and the outer ring consists of yellow points. Both rings are surrounded by a light gray shaded region representing a confidence interval or uncertainty. The axes range from -20 to 20.
